The movement derivation of conditional clauses

Liliane Haegeman

Department of English, University of Ghent

Abstract

By analogy with the proposals for the analysis of temporal adverbial clauses as free relatives, some authors have recently proposed that conditional clauses be derived by leftward operator movement (Bhatt and Pancheva 2002, 2006, Arsenijević 2006, Lecarme 2008). This paper offers supporting evidence for this analysis: in that it is shown that the movement analysis of conditional clauses allows us to account for the fact that Main Clause Phenomena are excluded in conditional clauses because this follows from intervention effects. Moreover, on the specific implementation of the analysis proposed here, which adopts the cartographic approach along the lines of Cinque (1999) and Cinque and Rizzi (2008), the account also predicts that conditional clauses will be incompatible with the speaker oriented IP-internal modal expressions (in the sense of Cinque 1999). Again, when present such modal markers block the operator movement postulated to derive the conditional clause. Finally, the specific implementation of the movement analysis proposed predicts that conditional clauses lack the low construal reading which is found in (some) temporal adverbial clauses (cf. Bhatt and Pancheva 2002, 2006), a fact which initially had been seen as evidence AGAINST a movement derivation (cf. Citko 2000). The paper thus reinterprets one of the potential objections against the movement account of conditional clauses into an argument in favour.
1. Introduction

By analogy with the proposals for the derivation of temporal clauses, some authors have recently proposed that conditional clauses be derived by leftward operator movement (Bhatt and Pancheva 2002, 2006, Arsenijević 2006). In this paper I provide supporting evidence for this analysis. On the one hand, the movement analysis of conditional clauses allows us to account for the fact that Main Clause Phenomena are excluded in conditional clauses, sentence initial circumstantial adjuncts are allowed. Moreover, on a specific implementation of the analysis, which I elaborate here, the account also predicts that high modals (in the sense of Cinque 1999) are excluded in conditional clauses and that conditional clauses lack the low construal reading which is found in (some) temporal adverbial clauses. The latter point means that the paper removes one of the original obstacles for the movement account of conditional clauses.

The paper is organized as follows: Section 2 summarizes the arguments in favour of the hypothesis that temporal when clauses are derived by wh-movement of a temporal operator to the left periphery. It is argued that the adjunct-argument asymmetry with respect to fronting operations, discussed in Haegeman (2007, to appear a,b) offers further support for this analysis. Section 3 discusses the application of this analysis to conditional clauses and discusses the lack of low construal readings, which has sometimes been taken to be an argument against the movement derivation of conditional clauses. Section 4 discusses the absence of high modal expressions in conditional clauses, a phenomenon often noted in the literature, and shows how it can be made to follow from a particular implementation of the movement analysis of conditional clauses. It is also shown that this
particular implementation in addition accounts for the absence of low construal. Section 5 discusses some comparative evidence with respect to the extent to which emphasis markers may or may not be present in conditional clauses. Section 6 briefly discusses so-called peripheral conditional clauses, which are compatible with MCP and examines two accounts for them. Section 7 is a brief summary.

2. Background: adverbial clauses as free relatives

2.1. Starting point: the movement derivation of temporal adverbial clauses

In the literature it has been proposed at various points (Geis 1970, 1975; Enç 1987: 655; Larson 1987, 1990; Dubinsky & Williams 1995; Declerck 1997; Demirdache & Uribe-Etxebarria 2004: 165-170, Lecarme 2008) that temporal adverbial clauses (1) are derived by wh-movement of a temporal operator (e.g. when) to the left periphery. One prime argument for this hypothesis is the observation that the when-clause in (1) is ambiguous between a high construal and a low construal of the temporal operator:

(1) I saw Mary in New York when [IP she claimed [CP that [IP she would leave.]]]

(i) high construal: at the time that she made that claim;
(ii) low construal at the time of her presumed departure.
Adopting the movement analysis high and low construal can be represented as (2a) and (2b) respectively (Larson 1987, 1990). There are a number of different implementations, but these are not relevant for the present discussion.

(2)  a  I saw Mary in New York \[CP \text{when}_i [IP \text{she claimed}_t [CP t_i \text{that}_t [IP \text{she would leave}_t]]]]

b  I saw Mary in New York \[CP \text{when}_i [IP \text{she claimed}_t [CP t_i \text{that}_t [IP \text{she would leave}_t t_i]]]]

As shown by Larson (1990: 170), going back to Geis (1970, 1975), the temporal operator \textit{when} can be extracted from the complement clause of \textit{claimed} in (1/2b), giving rise to the low construal reading. Extraction of the same operator from the complement of the N \textit{claim} in (3), an island for extraction, will give rise to a violation of the Complex Noun Phrase Constraint (i.e. the ban on extraction from complex NPs) and hence lead to ungrammaticality (cf. Demirdache and Uribe-Etxebarria (2004: 165-176), Penner and Bader (1995)). Thus the low construal reading is not available in (3).

(3) I saw Mary in New York
when \[IP \text{she made}_t [DP \text{the claim}_t [CP \text{that}_t [IP \text{she would leave}_t]]]]

(i) high construal: at the time that she made that claim;
(ii) low construal: *at the time of her presumed departure.

2.2. Additional support for the movement analysis
In my own work (Haegeman 2007a, to appear a,b) I have offered additional syntactic evidence for the movement analysis of temporal adverbial clauses. Such an analysis, coupled with a theory of locality on movement, will allow us to predict that adverbial clauses are incompatible with syntactic phenomena usually referred to as main clause phenomena (MCP) in the literature. One instance of such MCP, which I have discussed in some detail, concerns argument fronting. English adverbial clauses are incompatible with argument fronting (cf. Maki et al 1999). The ungrammaticality of (4a) follows directly from the movement account: operator movement of when would be blocked by the fronted argument this column .

(4)  

a  *When this column she started to write last year, I thought she would be fine.

b  *When this song I heard, I remembered my first love.

Furthermore, I have shown that there is an argument/adjunct asymmetry with respect to the left periphery of temporal adverbial clauses: while argument fronting is ungrammatical in English (4a,b) temporal adverbial clauses, circumstantial adjuncts may precede the subject:

(4)  

c  When last year she started to write this column, I thought she would be fine.

This contrast also follows from the movement analysis, because it is independently known that operator movement may cross a circumstantial adjunct while it may not cross an argument in the left periphery. (5) illustrates this contrast for relative clauses (see Browning 1996, Rizzi 1997 for discussion).
(5)  a  These are the students who in the next semester will study these text.
       b  *These are the students who these texts will study in the next semester.

       c  There was a time when at university level they did not teach these courses.
       d  *There was a time when these courses they did not teach at university level.

While argument fronting is ungrammatical in temporal adverbial clauses in English, clitic left dislocation (CLLD) is not excluded in Romance. For instance in French (6) the CLLD constituent *cette chanson* (*this song*) is found in the left periphery of the temporal clause. The example contrasts with English (4b):^4

(6)  Quand cette chanson je l’ai entendue, j’ai pensé à mon premier amour. (French)

When this song I it have heard-FSG, I have thought of my first love

Once again under the movement analysis of temporal adverbial clauses the contrast between English topicalisation and French CLLD is not surprising, since CLLD is independently known to give rise to fewer intervention effects than English argument fronting. For instance, while English argument fronting is ungrammatical in an embedded interrogative *when* clause, CLLD is grammatical in the same environment in French:^5

(7)  a  *I wonder when this song I have heard.
       b  Je me demande quand cette chanson je l’ai entendue.  (French)

     I myself ask when this song I it have heard-FSG
‘I wonder when I heard this song before.’

These data also show that adverbial clauses must allow at least some left peripheral projections. In addition it has been observed that in French stylistic inversion is allowed in temporal clauses, at least for some speakers:

(7) c.Fr.  Je voulais partir quand sont arrivés les enfants.

I wanted to leave when are arrived the children (Lahousse 2003 : 280, (1))

If, as argued by Kayne and Pollock (2001) Stylistic inversion involves an important chunk of the left periphery, these data too demonstrate that the left periphery is available in temporal clauses.

Hence, accounting for the lack of argument fronting in temporal clauses by claiming that the left periphery in general or the topic projection in particular is not available will not be an option.

As mentioned, so-called main clause phenomena in general (Hooper and Thompson 1973, Green 1976, 1996, Emonds 1976, 2004) are barred from temporal adverbial clauses: (8a) illustrates Locative Inversion (for recent discussion see among others, Culicover & Levine 2003, Rizzi and Shlonsky 2006 and reference cited there), (8b) illustrates preposing around be (Hooper & Thompson 1973: 467; Emonds 1976), (8c) illustrates VP preposing (Hooper & Thompson 1973:466; Emonds 2004: 78).
(8)  a  *We were all much happier when upstairs lived the Browns. (Hooper & Thompson 1973: 496 (their (253)))

b *When present at the meeting were the company directors, nothing of substance was ever said.

c *When passed these exams you have, you’ll get the degree.

As the MCP illustrated in (8) are usually also taken to implicate movement to the left periphery, their incompatibility with adverbial clauses follows from the movement account: the movement required to derive the MCP in (8) will interfere with the operator movement which derives the temporal clause. I will not pursue the discussion of the intervention effects in temporal adverbial clauses in this paper and refer to my own work (Haegeman 2007a, to appear a/b).

3.1. Conditional clauses are derived by movement

The argument/adjunct asymmetry observed in relation to fronting operations in temporal adverbial clauses is also found in conditional if clauses, as shown in (9):

(9)  a  *If these exams you don't pass, you won't get the degree.

b  If on Monday the share price is still at the current level then clearly their defence doesn’t hold much water. (Observer, 11.7.4, Business, p. 22 col 5)
In addition to argument fronting (9a), the other MCP illustrated in (8) above are also illicit in conditional clauses: (10a) illustrates Locative Inversion, (10b) illustrates preposing around *be*, (10c) illustrates VP-preposing.

(10) a *If upstairs live his parents things will be much simpler.
    b *If present at the party are under age children, they won’t be able to show
       the X-rated films.
    c *If passed these exams you had, you would have had the degree.

If, like temporal adverbial clauses, conditional clauses are derived by operator movement, then the adjunct/argument asymmetry in (9) and the fact that MCP are ungrammatical (10) follows. A movement analysis of conditional clauses has been proposed by Bhatt and Pancheva (2002, 2006), Arsenijevic (2006), Lecarme (2008) and Tomaszewicz (to appear).²

Bhatt and Pancheva (2002, 2006) argue for the derivation of conditional clauses in terms of movement of a World operator to SpecCP. They say: ‘Our proposal that [conditional clauses] are interpreted as free relatives amounts to the claim that they are definite descriptions of possible worlds.’(Bhatt & Pancheva 2006: 655). (11a) would be derived by the leftward movement of a World operator, as shown in representation (11b):

(11) a If John arrives late

    b [CP OP w C° [John arrives late in w]]
As was the case with temporal clauses, the intervention effects illustrated in (9) and in (10) thus offer empirical support for Bhatt & Pancheva's proposal.

The movement analysis of conditional clauses finds cross-linguistic support. I provide some illustrations here. For Italian conditional clauses, Cardinaletti (2008) contrasts the distribution of 'resumptive preposing', a leftward movement without clitic resumption whose syntactic properties Cardinaletti shows are similar to English topicalisation, and CLLD. Resumptive preposing is not, and CLLD is, compatible with conditional clauses:

(12)  

a * Se la stessa proposta fa anche l’altro candidate,  
If the same proposal makes also the other candidate,  
non otterrai quel posto  
\textit{non obtain-FUT-2SG that position} (Cardinaletti 2008: (19a))

b ok Se la stessa proposta la fa anche l’altro candidate,  
If the same proposal it makes also the other candidate,  
non otterrai quel posto  
\textit{non obtain-FUT-2SG that position} (Cardinaletti 2008: (22a))

Following the movement account elaborated here, the ungrammaticality of (12a) can be ascribed to an intervention effect. On the other hand, (12b) remains grammatical because in general CLLD does not lead to the same type of intervention effects (cf. Haegeman 2008).
Similarly, in his discussion of Italian conditional clauses, Bocci (2007: 15, his (32)) provides the following contrast: while CLLD is possible (as we have seen), focalization is degraded.

(13)  a  Se l’esame scritto non lo supera, non otterrà il diploma.
      If the written exam [s/he] does not it-pass, [s/he] will not get the diploma.

.  b  ??Se LA PROVA ORALE non supera, non otterrà il diploma!
      If THE ORAL EXAM [s/he] does not pass, [s/he] will not get the diploma!

Once again, adopting a movement account of conditional clauses, the ungrammaticality of (13b) follows from an intervention effect.⁸

3.2. Additional support

3.2.1. Temporal adverbial clauses and conditional clauses

The movement analysis proposed here aligns conditional clauses with temporal adverbial clauses. Anecdotal support for this comes from the observation that in many languages the prototypical ‘conjunction’ to introduce a temporal adverbial clause is isomorphic with that which introduces a conditional. This is the case, for instance, in German: Bhatt and Pancheva (2006) give (14), their (7a). The conjunction wenn introduces both conditional (14a) and temporal (14b) clauses:
(14)  a  Wenn Steffi gewinnt, wird gefeiert. German
if Steffi wins AUX- PASSIVE celebrate-PART
‘If Steffi wins, there is a celebration.’

b  Wenn Steffi kommt, fangen wir an zu spielen. 
‘when Steffi arrives, begin we to play
‘When Steffi arrives, we begin to play.’

Bhatt and Pancheva (2006: 657) comment: ‘There seems to be no evidence suggesting that
the syntactic behavior of wenn is different in conditional and in temporal clauses, i.e., it
does undergo A’-movement in both cases. (Bhatt & Pancheva 2006: 657).

In West Flemish (WF) too, the conjunction oα serves to introduce both a temporal
clause and a conditional clause:

(14)  b  Kgoan kommen oα-j doa zyt.
I will come if you there are
‘I’ll come if/when you are there’.

In line with Bhatt and Pancheva (2002, 2006), Lecarme (2008) also assumes that
conditionals are ‘modalized free relatives’ (2008: 210).

3.2.2. Yes no questions and conditionals
Further support for postulating an operator in the left periphery of conditional clauses may be derived from their formal parallelism with *yes/no* questions. Consider the data in (15):

(15)  

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>I asked him if he had said that he would leave</td>
</tr>
<tr>
<td>b</td>
<td>If he had said that he would leave…</td>
</tr>
<tr>
<td>c</td>
<td>Had he said that he would leave?</td>
</tr>
<tr>
<td>d</td>
<td>Had he said that he would leave….</td>
</tr>
</tbody>
</table>

Embedded *yes/no* questions are introduced by the conjunction *if*; the same conjunction is used for conditionals (15a,b). As shown by (15c,d) above, I-to-C movement which typically derives root *yes no* questions may be used to derive a conditional clause (see Bhatt & Pancheva 2006: 657-661 for discussion). It may be postulated that in cases of inversion, I-to-C movement is triggered by a checking relation between a head feature of I and the operator in the left periphery. In the case of *yes/no* questions and of conditional clauses, the relevant operator would have to be non overt.

Support for postulating a non-overt interrogative operator in the left periphery is to be found in the Germanic Verb Second (V2) languages. The Dutch analogue of (15c), (16a), shows that in V2 languages, direct *yes/no* questions constitute an apparent exception to the V2 constraint in that here the fronted verb seems to be the first constituent. On the assumption that *yes/no* questions contain an abstract operator in their left periphery (16b), the V2 constraint can be fully maintained: the null operator occupies the initial position and the finite verb is in second position. If we also assume that the relevant operator originates in a lower position, then *yes/no* questions can be derived by operator movement. Recent authors who postulate there is a null operator in the left periphery of
yes no questions include Barbiers (2007: 102-103 for arguments from Dutch), and Den Dikken (2006: 729). If root yes/no questions, which display SAI, are derived by the movement of a null operator to their left periphery, the formally identical conditional clause in (16c) could by analogy also be said to contain an operator in its left periphery which is, by assumption, moved from a lower position:

(16)  

\[ (\text{a}) \quad \text{Had hij gezegd dat hij zou vertrekken?} \]
\[ \text{had he said that he would leave} \]
\[ (\text{b}) \quad [\text{CP OP [Vfin had]} [\text{TP Subject ... t_{op}}]] \]
\[ (\text{c}) \quad \text{Had hij gezegd dat hij zou vertrekken, ik zou teruggebeld hebben.} \]
\[ \text{Had he said that he would leave, I would back-called have} \]
\[ \quad \text{‘Had he told me he was leaving, I would have called him back.’} \]

If direct yes/no questions are derived by the movement of an abstract operator to their left periphery, the relevant operator may be taken to also be present in indirect yes/no questions and the movement analysis can be extended to the derivation of indirect yes/no questions. Once again, the same derivation could be appealed to for the conditional analogue introduced by if (17). 

(17)  

\[ (\text{a}) \quad \text{I wonder if he said he would leave} \]
\[ (\text{b}) \quad [\text{CP Op if [he said he would leave t_{op}}]] \]

A movement account for the derivation of yes/no questions accounts for the fact that English argument fronting is excluded from embedded yes/no questions.
*Bill asked if such books John only reads at home (Schachter 1992: 108 (16a))

b ??/*John knows whether this book Mary read (Maki et al 1999: 9, note 8, their (i))¹⁴

Based on the parallelisms observed between yes/no questions and conditional clauses; Arsenijevic (2006) analyses conditionals as the relative variant of yes/no questions:

I analyze conditionals as yes-no relative clauses: a restrictive relative clauses in which the truth value of a proposition is restricted. The proposition represented by the conditional clause restricts the set of worlds compatible with the proposition represented by the head clause. Syntactically, the locus of modification is a functional projection called WorldP, the projection that specifies the truth value of clauses by containing the feature world with a value, [actual] or [possible].’

Arsenijević (2006: abstract)

3.3. Absence of low construal

Recall that the initial motivation for the movement account of temporal adverbial clauses was the availability of low construal readings in (2a). This argument, however, does not transpose to conditional clauses. Bhatt and Pancheva observe that, unlike temporal clauses, conditional clauses do not allow the low construal found with temporal adverbial clauses (see also Geis 1985, Bhatt & Pancheva 2002, 2006):
(18) a I will leave if you say you will. high/*low
    b Had he said he would leave, I would have left. high/*low

(cf. Bhatt & Pancheva 2002: 13, a-b based on their (50a,c), (51e), 2006: 655-6: based on their (47a,c, their (48b))

**WF** *oa* allows for both a temporal (‘when’) and a conditional (‘if’) reading (19). In (19) the adverbial clause may have a temporal reading (‘when’) or a conditional reading (‘if’). In the former reading both high and low construal are available, but in the conditional reading only high construal is available. Similar facts hold for other languages, e.g. German *wenn* discussed in Bhatt & Pancheva (2002, 2006), and Polish *jak* (discussed in Citko (2000)).

(19) Ge moet kommen oan-k jen zeggen da-j moe kommen.

  you must come when-I you say that-you must come
  ‘You must come when/if I tell you to.’

The absence of low construal in conditionals as opposed to its availability in temporal clauses has indeed been taken by some as direct evidence that in conditional clauses are not derived by movement.

As has been noted by Geis (1970) and Larson (1987), the unavailability of long distance construals is what distinguishes *if* clauses in English from *when* clauses. This difference is standardly attributed to the possibility to move the *wh*-pronoun
when long-distance, which correlates with the long distance construal. In the case of if clauses, on the other hand, the option of long-distance movement does not exist, since if, being a complementizer, is base generated in C°. (Citko 2000:6)

That conditionals are not derived by operator movement is, however, not the conclusion drawn by Bhatt & Pancheva (2002, 2006), who, in spite of the fact that conditional clauses resist low construal, adopt a movement account. To account for the absence of low construal, Bhatt & Pancheva (2002, 2006) propose that the moved World operator must locally bind its variable.15

Recall that Arsenijević (2006) treats conditional clauses on a par with yes/no questions. This parallelism is confirmed with respect to the locality of the operator movement: like conditionals, yes/no questions do not allow for a low construal reading of the operator.16 In the embedded yes/no interrogative in (20), the question bears on the polarity of the proposition introduced by if (‘he said’) and not on the proposition embedded under said (‘he would leave’). I return to this point in section 4.3.3.

(20) I wonder if he said he would leave.

4. Modal expressions and conditional clauses

4.1. Restrictions on modal expressions in conditional clauses

It has often been observed in the literature that certain ‘high’ modal expressions are incompatible with conditional clauses. Typically, expressions of speech act modality (21a),
evaluative modality (21b,c.), evidential modality (21d) and epistemic modality (21e,f) lead to ungrammaticality when they appear in conditional clauses.

(21) a ??*If frankly he's unable to cope, we'll have to replace him.
   b  * If they luckily /fortunately arrived on time, we will be saved.
      (Ernst 2007: 1027, Nilsen 2004).
   c  *If she has luckily been offered the job, I will be very happy.
      (Ernst 2008: 7, his (22a))
   d  *If George unfortunately/oddly  comes, the party will be a disaster.
      (Ernst 2008: 16, his (55c)
   d  *If the students apparently can’t follow the discussion in the third chapter, we’ll do the second chapter.
   e  *If George probably comes, the party will be a disaster.
   f  * John will do it if he may/must have time. (Declerck & Depraetere (1995: 278) Heinämäkki 1978: 22, Palmer (1990: 121, 182)

The data are complex and I refer to Ernst (2008) for subtle discussion of complicating factors, but as a general trend it seems clear that such expressions of modality are not easily compatible with conditional clauses. The restriction on modals in conditional clauses is not English specific. For example, Lahousse (2008: 22) and Ernst (2008:10) discuss the same constraints in French; Ernst (2008: 10) also illustrates the constraint for Dutch and Chinese; Tomasczewiz (to appear) shows the same restrictions obtain in Polish.

If we assume with Cinque (1999) that the high modal expressions illustrated above are IP-internal, then it is at first sight not clear how their unavailability in conditionals can
follow from some particular constraint on the left periphery of conditionals. However, in terms of their interpretation the relevant modal markers are all associated with the speaker’s point of view and modify the assertive force. If MCP can be argued to depend on speaker assertion, the absence of the modal markers, which all implicate the point of view of the speaker (cf. Tenny 2000: 29), might be seen as another instantiation of the absence of MCP in conditional clauses (cf. Heycock 2006: 188).

The absence of modal markers seems to correlate with the absence of argument fronting (and of MCP in general). There have been explicit proposals to relate the two phenomena. I provide two relevant citations: the first from Whitman (1989), the second from Bayer (2001). For a recent discussion of the correlation between modal markers and topicalisation see also Hrafnbjargarson (2008).

It is well known that -un/-nun marked topics in Korean and -wa marked topics in Japanese are restricted in most embedded contexts… modals are also blocked from appearing in the embedded contexts which disallow topics. (Whitman 1989: ms. p. 5)

... this form of [emphatic, lh] topicalisation is the grammar’s reflex of the speech act to be performed and is as such on a par with German constructions involving modal particles like aber, denn, doch, ja etc. Modal particles supply features which interact with other features such as [WH] yielding a wide range of illocutionary forces. Bayer, 2001: 14-15)

...if emphatic topicalisation belongs to the class of grammatical means of force projection in the sense of Rizzi (1997), its root clause property and strict left peripherality [in Bavarian] are not surprising.’ (Bayer, 2001: 14-15, italics mine)
In Haegeman (2006a,b,c) I relate the distribution of modal markers and that of MCP in English by arguing that both depend on the availability of assertion, and I formalize this by postulating an independent projection ForceP in the left periphery. Below I will explore two alternative accounts that derive the absence of high modal markers in conditional clauses from the movement account of conditional clauses. The first proposal, elaborated in Haegeman (to appear c), fits in with proposals in Haegeman (2006b,c) and relates the availability of the high modal markers directly to the syntactic encoding of illocutionary force. The second account explores a proposal put forward in Haegeman (2007a) and adopts Cinque’s approach to the adverbial hierarchy.

4.2. ForceP and the licensing of high modals

Formalising an intuition going back to Hooper and Thompson (1973), Haegeman (2006b,c) proposes that assertion is syntactically encoded in a specialized projection to encode illocutionary Force, here labeled ForceP. In the literature, there is a convergence that speech act is encoded by a functional projection high in the left periphery (cf. Ernst (2002: 70ff); Speas and Tenny (2003); Meinunger (2004), Hill (2007a,b); Abraham (2008)) and many others) as in (22a). Adopting the split CP hypothesis (Rizzi 1997) and following Bhatt &Yoon (1992), Rizzi (1997: note 6), and others, Haegeman (2006b,c) makes a distinction between the functional head ‘Force’ and the head hosting the subordinating conjunction, labelled ‘Sub’. (cf. Haegeman 2002, 2003a). In assertive declarative clauses Force hosts an abstract Assertion operator.

(22)  a  [SubP [ForceP OP [FinP [TP Sheila has left the office]]]]
Not all ‘declarative’ clauses are assertive. Temporal adverbial clauses and, crucially for our purposes, conditional clauses are a case in point: while they might be argued to be ‘declarative’, crucially they are not assertions. Haegeman (2006b,c) proposes that the left periphery of such adverbial clauses is impoverished and lacks the Assertion operator: either because the projection ForceP is absent, or, alternatively, because ForceP is projected but lacks the Assertion operator in its specifier.

The absence of the Assertion operator in conditional clauses was stipulated in the earlier account and seen as a direct correlation of the fact that such clauses are not interpreted as assertions. In the present account the unavailability of the Assertion operator follows from the intervention effect. In order to derive the conditional clause, i.e. a free relative, I propose that a TP-internal operator moves to the left periphery (say to the specifier of Sub\(^18\)). But if the assertion operator occupies SpecForce,P then on its way to the left periphery the ‘conditional’ operator would have to cross the Assertion operator (OP). By intervention, the Force operator blocks the movement of the conditional operator. This is schematically represented in (22b), where the asterisk should be related to the representation.

(22)  b  *John will leave \([\text{SubP} \text{OP}_{\text{COND}} \text{ if} \]

\[
[\text{ForceP} \text{OP}_{\text{ASS}} [\text{FinP} [\text{TP Sheila leaves the office OP}]]])
\]

In Haegeman (2006b,c, to appear b) I propose that high modals are licensed by the assertion operator for their licensing. Hence, if the Assertion operator in ForceP is unavailable in conditional clauses as an effect of the movement of the conditional operator,
it will follow that the high modals will not be licensed. The account in Haegeman (2006b,c) also postulated that argument fronting in English depended on the availability of the operator in ForceP. In that account, the movement account of adverbial clauses had not yet been adopted. As discussed above, assuming the movement account of adverbial clauses we derive the absence of argument fronting without recourse to the Assertion operator.

The analysis developed in this section hinges on the assumption that illocutionary force is encoded in a specific projection in the left periphery and that high modals are directly licensed by the Assertion operator associated with this projection. In the next section, I propose an alternative which derives the absence of high modals directly from the adverbial hierarchy postulated in Cinque (1999).

4.3. Intervention and the licensing of high modals

4.3.1. Cinque’s Specifier approach to adverbials

Cinque (1999) proposes that adverbials be merged as specifiers of hierarchically organised specialized functional projections which constitute the backbone of the clausal structure and that the heads of the relevant modal projections also host modal auxiliaries. The layered structure represented in (23) is located in the TP domain (see Cinque 199: 84)

(23) \[
\text{MoodP}_{\text{speech act}} > \text{MoodP}_{\text{evaluative}} > \text{MoodP}_{\text{evidential}} > \text{ModP}_{\text{epistemic}} > \text{TP (Past) > TP (Future) > MoodP}_{\text{irrealis}} > \text{ModP}_{\text{alethic}} > \text{AspP}_{\text{habitual}} > \text{AspP}_{\text{repetitive}} > \text{AspP}_{\text{frequentative}} > \text{ModP}_{\text{volitional}} > \text{AspP}_{\text{celerative}} > \text{TP (Anterior) > AspP}_{\text{terminative}} > \text{AspP}_{\text{continative}} > \text{AspP}_{\text{retrospective}} > \text{AspP}_{\text{proximate}} > \text{AspP}_{\text{durative}} > \text{AspP}_{\text{generic/progressive}}
\]
AspP_{prospective} > ModP_{obligation} > ModP_{permission/ability} > AspP_{completive} > VoiceP > AspP_{celerative} > AspP_{repetitive}

> AspP_{frequentative} (Cinque 2004: 133, his (3))

Based on data from Koster (1978), Cinque (1999) shows that adverbials obey rigid ordering constraints. As shown by Koster, the evaluative adverbial *helaas* (‘unfortunately’) precedes the epistemic adverbial *waarschijnlijk* (‘probably’) (24a). The alternative order (24b) is ungrammatical.

(24)  
a  Hij is helaas waarschijnlijk ziek  
MoodP_{evaluative} \rightarrow \ldots \rightarrow ModP_{epistemic}  
he is unfortunately probably ill

b  *Hij is waarschijnlijk helaas ziek*  
*ModP_{epistemic} \rightarrow \text{MoodP}_{evaluative}*

Movement of an adverb lower in the hierarchy across an adverb higher in the hierarchy disturbs the rigid ordering constraints and leads to ungrammaticality. This is illustrated in (24c,d). In Dutch a root V2 clause may have a modal adverb as its first constituent. Let us assume that this order is derived by movement of the adverb to the left periphery. When more than one such high adverb is available, the highest adverb moves to first position. A lower adverb cannot cross a higher adverb to become the first constituent. Thus (24c) is grammatical: here the leftmost adverb *helaas* (‘unfortunately’) has been fronted. (24d) is ungrammatical: it would have to be derived by moving *waarschijnlijk* (‘probably’) across the leftmost evaluative adverb *helaas*, leading to an intervention effect. Thus in this account, the ungrammaticality of (24c) and (24d) is derived syntactically and follows from an intervention effect on the movement of the adverbial.
(24) c  Helaas is hij waarschijnlijk ziek. ...

MoodP\textsubscript{evaluative} > ... > ModP\textsubscript{epistemic}

d *Waarschijnlijk is hij helaas ziek

*ModP\textsubscript{epistemic} > ... MoodP\textsubscript{evaluative}

For the locality restrictions on such adverbials see also Rizzi (2004).

**4.3 2. Absence of high modals in conditional clauses**

In his discussion of the ban on high modals in conditional clauses, Ernst (2008) says that the ‘F –Spec account [such as Cinque’s account outlined above, lh] has nothing to say about why SpOAs [Speaker oriented adverbs, lh] are usually bad in …the antecedents of conditionals.’ (Ernst 2008: 7). He continues: ‘Such facts may be treated as a purely semantic matter (…) but for the F-Spec approach a semantic explanation must be an add-on to the basic syntactic account’ (Ernst 2008: 7). In what follows I will show that Ernst’s conclusion is not inevitable and that the F-spec hypothesis coupled with a movement account for conditional clauses can handle the observed patterns. In order to do this, I first reinterpret the analysis of conditional clauses as free relatives (Bhatt & Pancheva’s (2002, 2006), Arsenijevic 2006, Lecarme 2008: 210, Tomaczewicz to appear) in terms of Cinque’s articulated structures of TP. Concretely let us assume that Bhatt and Pancheva’s (2002, 2006) World operator which moves to the left periphery to derive a conditional clause originates in the Cinque’s MoodP (irrealis) (Haegeman (2007a) is a first proposal along these lines and see also Tomaszewicz (to appear) for an application to Polish).
Informally speaking, Irrealis mood is used ‘when the speaker doesn’t know if the proposition is true’ (Cinque 1999: 88); it signals that the event is not realised, i.e. is not true in the actual world of the discourse (cf Tomaszewicz (to appear), Willmot(2007) and Lahousse (2008:23) on the relevance of the realis/irrealis mood for conditionals).

Since it originates in SpecMoodP\textsubscript{IRREALIS}, the moved Irrealis operator belongs to the class of high modal markers in Cinque’s approach, and crucially, it shares features with these high modal markers. If we assume an approach to intervention according to which a constituent with the feature $\alpha$ blocks extraction of a constituent with the same feature in its c-command domain (for discussion in terms of cartographic approaches see, among others Rizzi 2004, Friedmann, Belletti and Rizzi 2009), this implementation of the movement approach to conditional clauses leads to the prediction that conditional clauses will be incompatible with modal expressions which are located higher than Mood\textsubscript{IRREALIS}, i.e. that conditionals are incompatible with expression of speech act mood, evaluative mood, evidential mood and epistemic modality. This is so because in the same way that intervention rules out the reordering of the high modal expressions (24c,d), movement of the Mood\textsubscript{Irrealis} operator across the higher adverbs leads to intervention effects. (25) is a schematic representation. The role of modals as interveners on operator movement is also signalled in Agouraki (1999: 30). I refer to her paper for discussion.

(25) $\left[ \text{MoodP}_{\text{speech act}} > \text{MoodP}_{\text{evaluative}} > \text{MoodP}_{\text{evidential}} > \text{ModP}_{\text{epistemic}} \right. > \text{TP (Past)} > \text{TP (Future)} > \text{MoodP}_{\text{irrealis}}$
Observe that this account remains compatible with the fact that circumstantial adjuncts can be fronted in conditional clauses (9b). Circumstantial adjuncts should be set apart from the adverbs associated with Cinque’s hierarchy:

If AdvPs proper occupy the specifier position of distinct functional projections above the VP…it seems natural not to assume the same for circumstantial phrases. This is particularly natural if the rigid ordering of AdvPs is a consequence of the rigid ordering of the respective functional heads. (Cinque 1999: 29, also: pp. 15-16 and 28-30).

As shown by Dutch (26a), the circumstantial adjunct vandaag (‘today’) has no fixed position vis-à-vis the high modal adverbs and may be interspersed among them. As shown by (26b) vandaag also does not block the movement of a high adverb to the left periphery:

(26) a Hij is (vandaag) helaas (vandaag) waarschijnlijk (vandaag) ziek.
    He is (today) unfortunately (today) probably (today) sick

    b Waarschijnlijk/Helaas is hij vandaag ziek.
       Probably/unfortunately is he today sick

Clearly, in terms of the account proposed here circumstantial adjuncts of the type vandaag (‘today’) must belong to a different class (in terms of Rizzi 2004) than the modal expressions (adverbs as well as auxiliaries) and are hence featurally distinct. If the two types of adjuncts are featurally distinct, then circumstantial adjuncts should not give rise to intervention effects with respect to the modal expressions.
Though it is of independent interest, I will not explore the contrast between modal adverbs and temporal adjuncts any further in this paper, but note that, for instance, the former cannot be clefted (27a), while the latter can (27b,c):

(27)  

a  *It is probably/obviously/fortunately/frankly that he left.  
b  It was yesterday/only recently that he left.  
c  It was initially that I was rather against the idea (Davies 1967: 5, (1a)8)

Furthermore, modal adjuncts cannot undergo wh-movement, while temporal adjuncts can: (cf. Cinque (1999: 17)). While an epistemic adjective can be the basis of a wh-interrogative (28a), its adverbial parallel probably cannot be questioned (28b). Similarly, the adjective fortunate can be the basis of a wh-exclamative, while the adverbial fortunately cannot (28c,d). The restriction on wh-movement of these adverbials itself remains subject to future research. One option is to assume that high adverbs are operators merged in their scope position and that they cannot undergo further movement. In contrast, circumstantial adjuncts have been argued to have a predicative relationship with the constituent which they modify (see Hinterhölzl (to appear) for a precise implementation).

(28)  

a  How probable/likely is it that he will be there?  
b  *How probably/likely will he be there?  
c  How unfortunate that he will not be there!  
d  *How unfortunately he will not be there.  
e  When did you hear that?  

How recently has he told you that?
Another contrast is that in general the high modal adverbs cannot undergo long movement (see Cinque 1999: 18 for discussion). In (29) the fronted adverbs must be construed with the matrix clause (‘he thinks’) and cannot have low construal.

(29)  a  Frankly, I do not understand that he wants to leave.
   b  Probably he thinks that Mary will come.
   c  Obviously, he thinks that Mary will come.
   d  Fortunately, he thinks that Mary will come.

(30) a  By tomorrow I think the situation will be clear.
   b  Next year the President believes that there will be a definite improvement in the functioning of the financial system.

There are a number of proposals in the literature to differentiate circumstantial modifiers from modal adverbials. For instance Alexiadou (1997) proposes that circumstantial adjuncts are complements to V, Laenzlinger (1996: 107) distinguishes quantifier adverbs such as the high modal adverbs from qualifier adverbs like circumstantial adjuncts on the basis of French data, Cinque (1999: 29) discusses some options to make the distinction, see
also Cinque (2004) and Hinterhölzl (to appear) for discussion of the syntax of prepositional circumstantial adjuncts.

4.3.3. Conditionals lack low construal

Recall that unlike temporal adverbial clauses, conditional clauses do not allow low construal readings (Bhatt & Pancheva 2002, 2006: 655, Geis 1970). Bhatt and Pancheva (2002, 2006) attribute this to a restriction on the specific properties of the World variable which, in their approach, must be locally bound. Put differently, unlike the temporal operator in adverbial clauses, the conditional operator moves locally. Bhat and Pancheva’s requirement that the variable bound by the conditional operator must be locally bound can now be made to follow from the implementation of the movement account proposed above. We assume that Bhatt and Pancheva’s World operator (my Irrealis operator) originates in the specifier of MoodIRREALIS and that the operator shares relevant features with the high modal expressions in the Cinque hierarchy. In other words the OperatorIRREALIS belongs to the same class as the ‘high’ expressions of modality in the Cinque hierarchy (23). Since the high modal (speech act, evidential, evaluative, epistemic) operators are seen not to undergo long movement (29), we can speculate that whatever property excludes the relevant long movement also excludes high movement of the OperatorIRREALIS that derives conditional clauses. 21

4.4. Yes/no questions
Recall that in line with Bhatt and Pancheva (2002, 2006) and Arsenijević (2006), this paper postulates there is a parallelism between the derivation of conditional clauses and that of yes/no questions, which I assumed would also be derived by the leftward movement of an operator. If the operator involved in deriving yes/no questions also originates in the specifier of the Mood_{IRREALIS} projection, we correctly predict the observation (McDowell (1987), Barbiers (2006)) that that yes/no questions are incompatible with the high modal markers.

(31) a *Must he have a lot of money?
b *Will he probably win the race?

5. Emphatic polarity as an MCP

The movement account of conditional clauses has further explanatory potential. A number of recent papers have highlighted that emphatic affirmation/denial may be associated with a specific structure in the left periphery. I illustrate some such patterns below. The patterns discussed here have been argued by the relevant authors to implicate an operator in the specifier of FocP in the left periphery. A movement account of conditional clauses predicts correctly that such expressions of emphatic affirmation are excluded from the conditional clauses: the focus operator which is required for the expression of emphatic affirmation/denial will interfere with the movement of the Irrealis operator for the conditional clause.
5.1. Emphatic polarity *bien/si* in the Spanish left periphery (Hernanz 2007a,b)

Hernanz (2007a,b) discusses the expression of emphatic affirmation by means of *bien* in Spanish. She proposes that when expressing emphatic affirmation *bien* is a wh-operator which is merged in SpecPolP and moves to specFocP. Hernanz (2007b: 131-139). (32a) has the representation in (32b):

(32)  

a  Pepito bien ha comido pasta. (Hernanz 2007b : 113 )

Pepito *bien* has eaten pasta

b  \[ \text{ForceP} \left[ \text{TopicP Pepito} \right] \left[ \text{FocusP bien} \right] \left[ \text{PolP t} \left[ \text{f} e_{j} \cdots \right] \right] \]

If conditional clauses are derived by leftward movement of an Irrealis operator we correctly predict their incompatibility with emphatic *bien*: indeed, the very presence of the operator in SpecFocP should suffice to rule out the sentence.

(32)  

c  Si Pepe (*bien) acaba a tiempo su tesis, ya te lo haré saber.22

If Pepe (*well) finishes the thesis on time, I'll let you know

In the Pavese dialect (Poletto 2008, Zanuttini 1997) a sentence final stressed particle *NO* (‘no’) serves to express emphatic negation.
(33) a. No ghe so ndà NO.  

Not there are gone NOT  

‘I did not go there’

To account for the final position of *NO in (33a) (her (9)), Poletto (2009:6) proposes

According to this analysis, NO is always moved from within the NegP where it originates [note omitted] to a Focus position, which, following standard assumptions on the structure of the clause in Italian is located low in the CP area. When NO is in first position, the sentence there is no IP fronting. When NO is in sentence final position, this is the result of a movement of the whole IP to a position, GroundP, which is located in the Topic field, higher than Focus (again following standard assumptions on the CP layer) [note omitted]

(30) b  

[S[SpecGroundP [IP no ghe so ndà] [Ground° [CPFocus NO] 
[FIP [IP no ghe so ndà]] [Fin° [IP no ghe so ndà]]]) (Poletto 2009:6, her (13))

Predictably sentence final NO will not be compatible with conditional clauses, the movement triggered by NO blocks the operator movement required to derive the conditional clause:

(33) d  

Dovrebbe finire il lavoro per stasera.  

Must-COND-3SG finish the work for tonight.

*Se non lo finisce NO, lo faccio io.

If *non it finish-3SG NO it do-1SG I (C. Poletto, pc. 22.10.08)

(33) e  

*Se non viene NO…
If not comes NO

If he is not coming,… (Poletto 2009: 9, her (37b))

5.3. Sentence final *ni* in Nupe (Kandybowicz 2007, 2008)

Kandybowicz (2007, 2008) discusses sentence final *ni* in Nupe. The semantic contribution of *ni* in (34a, b) is ‘to reinforce the polarity of the clause/add emphasis to the asserted truth or falsity of the sentence.’ (2008: 33) He proposes that *ni* is the expression of the left peripheral head Foc\(^0\), which \(\Sigma P\) to its specifier (34c). Once more the movement account of conditional clauses advanced here correctly predict that emphatic *ni* will be incompatible with conditional clauses:

(34)  

a  Musa ba nakàn ni:. (Kandybowicz 2008 : chapter 2 : (22))

Musa cut meat ni

‘Musa actually cut the meat.’

b  Musa ba nakàn à ni:. (Kandybowicz 2008 : chapter 2 : (23))

Musa cut meat NEG ni

‘Musa did not actually cut the meat.’

c  \([\text{FocP} [\Sigma P \text{Musa ba nakàn [\(\Sigma a\) [\text{Foc} ni:] [\Sigma P \ldots}}

d  *Musa gá ba nakàn ni:. Gana à du u: 23

Musa COND cut meat FOC Gana FUT cook 3RD.SG

‘If Musa DID cut the meat, then Gana will cook it.’
5.4. Emphatic polarity in conditional clauses.

At this point it is important to add that not all cases of what might be labeled ‘emphatic polarity’ are incompatible with conditional clauses. In particular, English emphatic *do* is compatible with conditionals, as is the negative particle *en* in colloquial variants of Flemish and in Flemish dialects, which according to Haegeman (2001, 2002) and Breitbarth & Haegeman (2008) is a marker of emphatic polarity. It follows that apparently emphasis on polarity is not necessarily a MCP.

(35)  

a If it does rain, you should water the flower bed.

b Oa’t nie en regent, moe-j de blommen woater geven
   if it not *en* rains, must you the flowers water give

(Breitbarth & Haegeman 2008)

One essential difference between the expressions of emphatic polarity which are incompatible with conditional clauses and those that are compatible with them is the fact that the former are part of the left periphery while the latter can be argued to be IP internal. (cf. Duffield (2007) for *do* insertion in English and Haegeman (2002) for an analysis of emphatic polarity *en* in Flemish). The contrast between polarity emphasis that leads to intervention effects and that which does not can be compared to the difference between focalization qua movement, which is an MCP, and focalization in situ, which is not:

(35)  

c If you invite JOHN, you’ll regret it.
Expressions of emphasis that do not give rise to MCP effects are found elsewhere and definitely deserve investigating further. For instance Carrilho (2008) signals the use of what seems like an expletive pronoun *ele* in European Portuguese, whose ‘presence correlates with an emphatic effect on the (i) expressive, (ii) command, or (iii) assertive values, respectively assumed by (i) exclamatives and special questions, (ii) imperatives, and (iii) declarative sentences’ (2008: 315). She also points out that ‘[t]he embedded contexts that allow the EP expletive are not limited to assertive *that*-clauses, however: they also include some adverbial clauses, such as *if*- and *when*- clauses. (Carrilho 2008: 317).

The following are due to Carrilho ((35c) p.c, (35d) from Carrilho 2005: 216, her (159)):

(35) c Se ela (...) tiver mestra, larga aqueles ovitos;
    if it have-*FUT.SUBJ* queen.bee releases those little.eggs
    se *ele* não tiver mestra, não larga nada.
    if EXPL NEG had queen.bee NEG releases anything
    ‘If it[the hive] has a queen bee, it releases those little eggs; if it doesn’t have any queen bee, it doesn’t release anything.’

d Se ele alguém disser alguma coisa, (...) diga-lhe que foi à minha ordem.
    if EXPL anybody sayFUT.SBJ.3SG anything tell- him that was to my order
    ‘If anybody says anything, you tell him that it was done under my orders.’

Once again the conclusion would be that encoding emphasis by *ele* is not a MCP. Carrilho (2005) discusses the possibility that there are two instantiations of Portuguese *ele*, one associated with the left periphery and one that occupies a lower IP-internal position (see
the discussion in Carrilho 2005:245-250). Evidence for this proposal are examples such as (35f), in which there are two instances of *ele*. We might then assume that when *ele* occurs in a conditional clause, it actually is the lower *ele*. Further research is needed here to clarify this.

(35)  

\[
\text{Ele} \text{ aqui debaixo tenho } \text{ele} \text{ assim uma pias para os pequeninos, para lá comeerm.}
\]

\text{Expl here under [this] have-1SG EXPL thus some sinks to the small.ones to there eat-INFL-3PL}

‘Here, under this, I have some sinks for the small ones, for them to eat here’.

(Carrilho 2005: 246, her (217))

6. Peripheral conditionals

In my previous work (Haegeman 2003a, 2006a,b,c) I have distinguished between ‘central’ conditional clauses and ‘peripheral’ conditional clauses. So called central conditionals express a condition for the realization of the state of affairs in the main clause. The conditional clauses discussed so far in this paper are ‘central’. The following attested examples contain what I have called peripheral conditional clauses.

(35)  

If I’m no longer going to be arrested for possessing cannabis for my own consumption (‘Cannabis laws eased in drugs policy shake-up’, October 24),
shouldn’t I be able to grow my own? (Jason Cundy, Letter to the editor Guardian, 25.11.1, page 9, col 8)

b If we are so short of teachers (‘Jobs crisis grows as new term looms’, August 30), why don’t we send our children to Germany to be educated? (Letters to the editor, Eddie Catlin, Norwich, Guardian, 31.8.1, page 9, col 5)

c We are seeing a fall in the incidence of crime, particularly serious crime, and I think we’re right to say ‘What’s going on?’ If crime is falling, why are we seeing a continuing rise in the prison population. (Guardian, 1.11.1, page 2, col 6)

d If the natural rhythms of modern politics are for the regular election of a new parliament every four years – as seems now to be the case – why don't we just legislate to make it so? (Guardian, 6.4.5. page 17 col 1)

Typically in the above conditional clauses the speaker is not expressing a condition for the realization of the event in the main clause, but he or she is making accessible a background assumption which provides the privileged background for the processing of the associated main clause. The peripheral conditional can be said to structure the discourse background of the associated clause. Declerck and Reed say:

closed P-clauses [≈ peripheral conditional clauses, lh] are always echoic in one sense or another. They can echo straightforward statements about the actual world, or they can echo Q-propositions about a nonfactual world. However, the claim that closed P-propositions are echoic need not mean that they have to be echoes of
actual utterances. They may also be echoes of an internal or mental proposition (thought) such as the interpretation of an experience, perception etc. (Declerck and Reed, 2001:83)

Unlike ‘central’ conditionals, peripheral conditionals are compatible with argument fronting (36a) and with ‘high’ modal markers, such as, for instance, expressions of epistemic modality (36b) (for discussion of modality see also Lahousse 2008):

(36)  a. If some precautions they have indeed taken, many other possible measures they have continued to neglect.

   b. If Le Pen will probably win, Jospin must be disappointed. (Nilsen 2004: 811: note 5)

There are a number of ways of interpreting the contrast between ‘peripheral’ conditionals and ‘central’ conditionals. Since they do not express a condition for the event expressed in the main clause, but are used to introduce contextually salient propositions, one might postulate that peripheral conditional clauses are not derived by movement of a conditional operator. A number of implementations of this idea are conceivable. One is that in peripheral adverbial clauses if is a simple connective and the clause it introduces does not contain an operator in its left periphery at all, or, alternatively, that there is an operator in the CP domain which is merged directly as the specifier of the head in which the connective is merged and crucially, that the operator has not been moved from MoodPirrealis to CP. If there is no operator in peripheral adverbial clauses, then there will be no intervention effect with respect to other fronting operations and we predict that they will be
compatible with main clause phenomena. If an operator is merged high in the CP domain it will not interfere with movement to relatively lower positions in the left periphery or with the availability of adverbials in the (high) IP layer.

Alternatively it might be proposed that peripheral conditional clauses are derived by movement of a conditional operator but that the movement in question takes place in a higher stretch in the left periphery which does not overlap with the stretch affected by argument fronting. In central conditional clauses, main clause phenomena such as argument fronting are excluded because the fronted constituent will intervene on the movement path of the conditional operator, which originates in SpecMood\textsubscript{Irrealis}, i.e. within the IP domain of the adverbial clause. Intervening fronted arguments occupy a position higher than the starting point of the moved temporal operator and lower than its landing site.

Peripheral if clauses could be paraphrased as ‘if it is true that’, ‘if we can admit that’. Such peripheral if clauses are arguably associated with speaker anchoring and with illocutionary force (for more discussion see Haegeman (2003a, 2006a, 2006b, 2007a), and also Komagata (2003)). If the illocutionary force is syntactically encoded, then peripheral if clauses might be argued to contain a conditional operator, but one associated with the speech act. One might then propose that in peripheral conditional clauses an operator associated with the high speech act phrase in the left periphery moves to a yet higher clause typing position in the left periphery. If the relevant operator movement takes place in a syntactic domain higher than the domain of argument fronting (and other fronting operations involved in MCP) there will not be any intervention effects. For arguments in favour of high speaker related projections see, among others, Benincà (2001), Hill (2005, 2006, 2007a: 177, 2007b), Paul (to appear), Haegeman (to appear d) etc. It is clear that the
choice of analysis will have repercussions for the structure of the left periphery and in particular for the question whether and how the syntax represents illocutionary force and force modifiers. This issue goes beyond the goals of this paper.

7. Summary

The paper elaborates Bhatt and Pancheva’s (2002, 2006) proposal that like temporal adverbial clauses, conditional sub-clauses are derived by operator movement to the left periphery. It is shown that this proposal can account for the absence of MCP in conditional clauses. A particular implementation of the proposal in terms of Cinque’s articulated TP allows one to account for the absence of high modal markers in conditional clauses and for the observation that low construal is incompatible with conditional clauses, an observation due to Geis (1970, 1985). The paper also further explores the parallelism between conditional clauses and yes no questions elaborated in Bhatt and Pancheva (2002, 2006), and in Arsenijević (2006).

To the extent that the analysis proposed here succeeds in offering a syntactic account of what might previously have been considered phenomena that purely belong to the domain of semantics/pragmatics (cf. Lahousse 2008 for such an approach and for references), the paper is a contribution to the cartographic research program as laid out recently by Cinque and Rizzi (2008: 39):

The cartographic studies can be seen as an attempt to “syntactician” as much
as possible the interpretive domains, tracing back interpretive algorithms for such properties as argument structure … scope, and informational structure (the “criterial” approach defended in Rizzi 1997 and much related work) to the familiar ingredients uncovered and refined in half a century of formal syntax. To the extent to which these efforts are empirically supported, they may shed light not only on syntax proper, but also on the structure and functioning of the cognitive systems at the interface with the syntactic module.

---

1 This paper was part of the presentation at the 35th _Incontro di Grammatica Generativa_ at the University of Siena and at the Department of Linguistics of the University of Venice. I thank the audience for their comments. Special thanks to Boban Arsenijević, Adriana Belletti, Guglielmo Cinque, Anna Cardinaletti, Alexander Grosu, Luigi Rizzi, Damien Laflaquière, Terje Lohndal, and Amelie Roquet for comments. Obviously they are not responsible for the way I have used their comments.

The research is part of the FWO project 2009-Odysseus-Haegeman-G091409.

2 High/low construal is also available with _before, until, (temporal) since_ (Larson 1990: 170). Low construal is unavailable with _while:_

(i) I didn’t see Mary in New York while she said she was there. (Geis 1970, Stump 1985, Larson 1990: 174, (11a))

3 For comparative data see Abels and Muriungi (2008).

4 Not all French speakers accept this example.

5 Observe that CLLD does block subject extraction in French. I will not dwell on this point here, which is tangential to the discussion. See Rizzi (1997) and Delfitto (2002) for discussion.

6 Not all speakers accept this example. Thanks to Amélie Roquet for judgement.

7 For discussion of the semantics see also von Fintel and Iatridou (2002, 2003).
Observe that conditional clauses may be a testing ground for syntactic analyses. For instance, in Italian, prepositional complements of verbs in the left periphery may appear with (ia) or without (ib) an IP-internal resumptive clitic:

(i) a Col capo non ci parla. (Garzonio 2008: 7)
    With-the boss not clitic speak
    ‘He doesn’t speak with the boss.’

b Col capo non parla.

Garzonio (2008) shows that in conditional clauses, when prepositional complements are dislocated only the variant with the clitic is available.

(ii) ?Se, col capi, non *(ci) parli, non puoi capire il problema.
    If with-the boss not *(clitic) speak-2sg, not can-2sg understand the problem.
    ‘If you don’t talk to the boss, you cannot understand the problem.’

Garzonio concludes that the clitic-less construction is analogous to English argument fronting.

9 Thanks to Amelie Roquet for help with the German examples.

10 See however Rizzi (2001) for a different account for embedded yes/no questions in Italian.

11 But see Roberts and Roussou (2002:41) for a different viewpoint.

12 I assume that if is merged in C.

13 For the movement analysis, cf. among others Larson (1985), Den Dikken (2006: 729), with evidence from the distribution of either in indirect question introduced by whether and if.

14 The data are more complex. Maki et al (1999: 9, note 8), point out that (39b) is ‘marginal in American English and almost grammatical in British English.’ The (British) speakers I consulted considered it ungrammatical. I intend to return to fronting operations in yes/no questions in later work.

15 Low construal is available with conditionals formed by relativization:

(i) I will leave in any circumstance in which you say you’ll leave.

(Bhatt & Pancheva 2002: 13, a-c their (50), d,e: their (51); 2006: 655-6: their (47))

I assume that such conditionals are genuine relative clauses.

16 In a different context, this point was also made in Ingham (2008).
For similar proposals see also Roussou (2000), Bentzen et al (2007a,b, 2008), Hernanz (2007a,b), and Julien (2008).

Benincà (2001) shows that the wh-constituent of free relatives moves as high as that of headed relatives.

A prediction of this account is that in structures lacking a left periphery, high modals should not be available. A potential problem is that epistemic modals remain available in diary style null subject sentences as those illustrated in (i) for which it has been proposed that they are truncated structures (TP/SubjP) (cf. Haegeman 1997, 2007b).

(i) Must be hot in Panama.
    Must be somebody waiting for you.
    May be some children outside. (Quirk et al 1985: 896-7)

Obviously the conclusions drawn from such data depend on the analysis adopted.

It could be that the adverbials, being non-referential and unable to combine with a referential feature, are incompatible with the topic or focus feature that can drive long movement. This needs to be looked at in future research.

Bhatt and Pancheva observe that low construal is available with conditionals formed by relativization:

(i) I will leave in any circumstance in which you say you’ll leave. (Bhatt & Pancheva 2002: 13, a-c their (50), d,e: their (51); 2006: 655-6: their (47))

I will assume that in such cases the wh-operator (in which) originates as a circumstantial adjunct and hence will have share properties with circumstantial adjuncts. One such property is that circumstantial adjuncts can undergo long movement:

(ii) Under these circumstances I don’t think he will agree to your proposal.

Thanks to M. Lluisa Hernanz for help on the data.

Hernanz (2007a,b) shows that bien is incompatible with temporal adverbial clauses.

Thanks to Jason Kandybowicz for the data.

Declerck and Reed (2001) refer to such conditionals as performative conditionals. This term is also adopted by Lahousse (2008).
In Haegeman (2003a) I argue that peripheral adverbial clauses are syntactically less integrated than central adverbial clauses and hence manifest other properties with respect to binding, scope, temporal and modal subordination etc. One way of integrating such clauses to the associated clause would be to adopt the ‘paratactic’ projection (πP) as in Gaertner (2001). Assuming such clauses are in a paratactic relation with the associated clause mediated by πP. The conjunction could, for instance, be inserted in π, as proposed for German weil by Gaertner (2001: 107).
